PREFACE.

Much care has been taken to *test the accuracy* of the Answers, and it ~~is~~ hoped the mistakes are few ; but in the preparation of Answers to so many problems, mistakes may have crept in unnoticed, and any corrections from teachers, using the books, will be thankfully received.

| 6. The first, by 763 lbs. | 13. 1 foot, 6 inches. |
| 7. \$71.28. | |

Exercise XXX.

1. 17136 times.
2. (a) $(2 \times 2 \times 3 \times 3 \times 5)$, $(2 \times 3 \times 3 \times 5 \times 7)$, $(2 \times 3 \times 5 \times 5 \times 7 \times 7)$.
 (b) I. G. C. M. = $(2 \times 3 \times 5)$ the *greatest* selection of common factors of these numbers = 30. II. L. C. M. = $(2^2 \times 3^2 \times 5^2 \times 7^2)$ the *smallest* selection of factors, including the factors of each given number = 44100.

3. (a) $(3 \times 5 \times 7 \times 13)$ and $(2 \times 5 \times 5 \times 7 \times 13)$. (b) (i.) G. C. M. is equal to $(5 \times 7 \times 13) = 455$; (ii) L. C. M. is equal to $(2 \times 5 \times 5 \times 7 \times 13 \times 3) = 13650$. (c) (i.) From (b) (i.) and (ii.) we have $G. C. M. \times L. C. M. = (5 \times 7 \times 13) \times (2 \times 5 \times 5 \times 7 \times 13 \times 3) = (3 \times 5 \times 7 \times 13 \times 2 \times 5 \times 5 \times 7 \times 13)$ all the factors of 1365 and 4550; (ii.) from (c) (i.) we see that G. C. M. is composed of the factors of 1365 and 4550 rejected by L. C. M. and *vice versa*; (iii.) G. C. M. and L. C. M. are made up of all the factors of 1365 and 4550 [c. (i.)]; therefore $G. C. M. \times L. C. M. =$ product of the two numbers (because G. C. M. and L. C. M. = *all the factors* of the given numbers); (iv.) since $G. C. M. \times L. C. M.$ of the two numbers = product of numbers; therefore their product \div one of the numbers = the other number, and *vice versa*; (v.) since product of the two numbers = $G. C. M. \times L. C. M.$; therefore their product \div G. C. M. = L. C. M. and *vice versa*.

4. 180.

5. (Theory).

6. 740.

7. The smallest number we could have for one is 240; therefore, 240 and 2880, or 726 (third multiple) and 960, etc. (N.B. all the multiples of 240 will not do, however).

8. L. C. M. 40; Quot., 525.

9. H. C. F., 5; L. C. M., 30.

9. (a) The L.C.M. of two numbers consists of the *smallest selection of factors which contains* the factors of each given number; and the H.C.F. of two numbers consists of the *greatest selection of factors common* to both numbers. The H.C.F. is composed of *all the factors rejected* by the L.C.M. and *vice versa*; therefore, the factors of the H.C.F. and L.C.M. comprise *all the factors of the two numbers*; and consequently, the H.C.F. multiplied by the L.C.M. is equal to the *product of the two numbers*, e.g. :—Question 9 (b). H.C.F. and L.C.M. of 2340 and 2520, which resolved into their prime factors =
 $\left. \begin{array}{l} 2340 = 2 \times 2 \times 3 \times 3 \times 5 \times 13. \\ 2520 = 2 \times 2 \times 2 \times 3 \times 3 \times 5 \times 7. \end{array} \right\}$ Now, the *greatest selection of factors, common* to these numbers, is $2 \times 2 \times 3 \times 3 \times 5 = 180$, the H.C.F.; and the *smallest selection of factors which contains* the factors of each of the given numbers, is $(2 \times 2 \times 3 \times 3 \times 5 \times 13) \times (2 \times 7) = 32760$, the L.C.M.; but these *are all the factors* of these two numbers; therefore the H.C.F. \times L.C.M. of any two numbers is the product of the two numbers; \therefore $\frac{\text{H.C.F.} \times \text{L.C.M. of any two No's.}}{\text{One of the No's.}}$

$$\begin{array}{rcl} & 31 \times 28520 & \\ \text{= the other No. (c) } & \frac{\quad}{713} & = 1240. \end{array} \quad \begin{array}{rcl} & 38760 & \\ \text{(d) } & \frac{\quad}{323} & = 120. \end{array}$$

$$10. \text{ L.C.M.} = 158230800; \text{ H.C.F.} = \frac{2}{3} \therefore 158230800 \times \frac{2}{3} = 35162400.$$

1. 1st time, $9\frac{9}{11}$ minutes past IX o'clock ; 2nd time, $22\frac{9}{11}$ minutes past IX o'clock.

2. With the Romans, the symbols used maintained their relative values, no matter in what order they were written ; thus, IX stood for 11, and was read *eleven*, just as XI ; and XL stood for 60, and was read *sixty*, just as LX, etc. Their system of notation was by *units, fives, tens, fifties, hundreds*, etc., instead of *units, tens, hundreds*, etc., as in our system, the symbols being written in that order, and each one repeated in accordance with their system of notation—I and X might be repeated *four* times, but V or D would not be required to be repeated as two V's = X, and two D's = M,

etc., etc. In writing them down, place like symbols under each other, i.e., units under units, fives under fives, tens under tens, etc.

V. $\frac{1}{5}$ of a lb., $\frac{2}{5}$ of a lb., $\frac{3}{5}$ of a lb., $\frac{4}{5}$ of a lb., ($\frac{5}{5}$ of a lb.) VI. The *TERMS* of the fraction. VII. 13. (a) (1) Write out in succession, the *MULTIPLES* of these numbers:—

24:—24, 48, 72, 96, 120, 144, 168, 192, 216, 240, 264, 288, 312,
336, 360, 384, 408, 432, 456, 480, 504, 528, 552, 576, 600,
624, 648, 672, 696, 720, 744, 768, etc.

42:—42, 84, 126, 168, 210, 252, 294, 336, 378, 420, 462, 504,
346, 588, 630, 672, 714, etc.

Now we see, by inspection, the *common multiples* of these numbers, and of these *multiples* 168 is the least; therefore it is the L.C.M.

2. Write out *all* the *prime factors* of these numbers:—

$$24 = 2 \times 2 \times 2 \times 3.$$

$$42 = 2 \times 3 \times 7.$$

Now the L. C. M consists of the *smallest (least)* selection of *factors* that contains the factors of each given number; therefore the L. C. M. is $2 \times 2 \times 2 \times 3 \times 7 = 168$.

(3). 2) 24, 42

3) 12, 21

$$4, 7 \quad \text{L. C. M.} = 2 \times 3 \times 4 \times 7 = 168.$$

(b) (1) All the measures of

(Factors).

(Co-factors).

$$96 = 1, 2, 3, 4, 6, 8.$$

$$12, 16, 24, 32, 48, 96.$$

$$240 = 1, 2, 3, 4, 5, 6, 8, 10, 12, 15, 16, 20, 24, 30, 40, 48, 60, 80, 120, 240.$$

Now the *common measures* are: 1, 2, 3, 4, 6, 8, 12, 16, 24, 48, and 48, the *greatest* of these, contains all the other measures; hence it is the G.C.M.

(2) Write out *all prime factors* of these numbers:

$$96 = 2 \times 2 \times 2 \times 2 \times 2 \times 3.$$

$$240 = 2 \times 2 \times 2 \times 2 \times 3 \times 5.$$

Now the greatest selection of measures (factors) common to these numbers is: $2 \times 2 \times 2 \times 2 \times 3 = 48$, the G.C.M.

After the first division we have 3 as remainder, which is one-fourth of 12, the numerator of the fraction ; now, complete the repetend from this point by reducing each remainder to *tenths* of the next lower order and dividing by 4, *e.g.* :—

$$\begin{aligned}
 \frac{12}{4} &= 3, \text{ and 2 as remainder ; now 2 is } \frac{1}{4} \text{ of 12.} \\
 &\quad \frac{1}{4} \text{ of 9 (first figure in decimal), etc.} \\
 &= 9 \div 4 = 2 \text{ and 1 over, } -10 \times 1 + 2 = 12. \\
 &12 \div 4 = 3 \text{ and 0 over, } -10 \times 0 + 3 = 3. \\
 &3 \div 4 = 0 \text{ and 3 over, } -10 \times 3 + 0 = 30. \\
 &30 \div 4 = 7 \text{ and 2 over, } -10 \times 2 + 7 = 27. \\
 &27 \div 4 = 6 \text{ and 3 over, } -10 \times 3 + 6 = 36. \\
 &36 \div 4 = 9 \text{ and 0 over, etc.} \\
 &\text{Dec.} = \cdot 92307692, \text{ etc.} \\
 &= \cdot 923076.
 \end{aligned}$$

(N.B.—The operation should be performed *mentally*.)
